

Company Statement of Problem of Interest:

The current paradigm of Data Security is not complete. Traditionally restrictions of data to a selected trusted circle of employees does not help much as once access is granted, the data is free to travel as requested by the user. The fact that 70% of employees leave the organization with data makes security measures questionable.

DAAnchor is all about remolding security and privacy into a new solid form. Although our technology and products speak for itself, under the hood we are working super hard to make it better every single day. Research and innovation is our biggest asset and our team is striving to build meaningful products that can bridge the market voids we have envisioned.

Internship Position 1:

Full Stack Engineer:

As a Full Stack engineer at DAAnchor, interns will be working on backend APIs that have the solid potential of powering our client-side apps and all our desktop agents. Our primary ingredients for cooking these powerful APIs are Node.js, python and MongoDB, so we would expect our engineers to have these couple of swords in their arsenal with an open and innovative mind towards embracing more tools, libraries or frameworks that can make things better for us. On the client facing side of things, we use React extensively to build our Dashboards and Desktop Apps. Mobile development is another area we are focusing on currently. We are looking for interns with knowledge in iOS or Android too. All our cloud services are powered by Docker and Kubernetes and we expect our interns to learn these technologies during the internship.

Skills required:

- Front End: React
- Backend: NodeJs, MongoDB, Algolia, Elasticsearch, TypeScript, Python, GraphQL, Docker, Kubernetes

- Mobile: Android and iOS
